No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 29,

New fusion molecules comprising polypeptide sequences that bind to IgG inhibitory receptor and native IgE receptor, useful for treating IgE-mediated hypersensitivity reactions, e.g. asthma or allergies, or autoimmune diseases.

Claim 21; Fig 6; 116pp; English.

The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (FcepsilonR). Also provided are nucleotide sequences encoding such a

fusion protein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated hypersensitivity reaction, such as asthma, allergic rhinitis, atopic dermatitis, severe food allergies, chronic urticaria, angioedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, type-I diabetes mellitus, or multiple sclerosis, and for preventing of, or symptoms resulting from, a type I hypersensitivity reaction in a subject recedving immunotherapy. The present sequence is the human IgE heavy chain constant region CH2-CH3-CH4 portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen cell presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in a naimal, which is useful for dwarregulating autologous IgE in the animal, which is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and aropic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in an B. Coli system, this sequence was used to create the epitopes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Region
 This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in the animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, autologous IgE in the animal. The present sequence represents the human igE heavy chain C2-C3-C4 domains optimised for expression in a mammalian system, this sequence was used to create the epitopes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       183
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         240

This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytocoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhintis, aschma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains used to create the epitopes of the
                                                                        Inducing immune response against autologous immunoglobulin E in an animal, by effecting simultaneous presentation of cytotoxic \tau lymphocyte epitope an/or B-cell epitope derived from the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 1707; DB 5; Length 323;

```
glycosylated Fc(epsilon) fragment. Altering the pattern of glycosylation unmasks new antigenic sites thus rendering the Fc fragment immunogenic and able to induce antibodies that recognise native IgB but do not form histamine-releasing complexes. The Fc fragments can be used in antiallergenic vaccines to modulate the intensity of immune responses
                                                                                                                                                                                                                                                                                                                                         FTPPTVKILQSSCDGGGHFPPTIQLLCLVSGYTPGTINITWLEDGQVMDVDLSTASTTQE

The DNA sequence was isolated from a human myeloma 266BL cDNA library screened with a probe corresp. to the N-terminus of IgE. The region encoding amino acids 218-547 was cloned into the vector pWT211 under control of the tryptophan promoter. The resultant protein produced contains some non-FC amino acids. These were removed by replacing their coding sequence with a bicistronic linker. The resultant construct encodes the FC(epsilon) constant heavy region from amino acids 226-547. When it is expressed in E.coli, the protein produced is a non-

                                                                                                                                                                                                                                                                                                                                                                                                                                  305
                                                                                                                                                                                        The sequence represents a mutant sequence of a human IgE-Fc chain (amino acids 224-547) which is of sufficient length to bind Fc-epsilon RI and/or Fc-epsilon FII IgE receptor sites on human cells. The protein is useful in the study and treatment of allergy. (Updated on 25-MAR-2003 to correct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence represents the wild-type sequence of a human IgE-Fc chain (amino acids 224-547) which is of sufficient length to bind Fc-epsilon RI and/or Fc-epsilon FII IgE receptor sites on human cells. The sequence is preferably mutated (see AAR75225) to represent a protein encoding a protein where Cys225 is mutated, optionally together with Val224, Ser226 and Arg227. The protein is useful in the study and treatment of allergy. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 RDWIEGETYQCRVTHPHLPRALMRSTTKTSGPRAAPEVYAFATPEWPGSRDKRTLACLIQ

New non-naturally occurring single chain protein comprising polypeptides with binding domain, connecting regions and N-terminally truncated immunoglobulin, having immunological activity, useful for neutralizing infectious agent.

Disclosure; Page 365; 590pp; English.

The invention relates to a non-naturally occurring ships contain protecting capable of binding to a target molecule, the binding domain polypeptide capable of binding to a target molecule, the binding domain polypeptide capable of binding to a target molecule, the binding domain polypeptide comprising a heavy chain variable region, which comprises an anahon acid substitution or deletion at one or more amino acid residues, a second polypeptide comprising a connecting region attached to the first complete or an a thind polypeptide comprising an N-terminally truncated immunoglobulin heavy chain constant region polypeptide attached to the second polypeptide, where the non-naturally occurring single-chain contains a target cell population in a subject (involving administering content a target cell population in a subject (involving administering to the subject a procein that is less than 150 kb, which involves treating the target cell population with a first protein or peptide that capable of at least coll population with a second protein or peptide molecule is directly connected to the second protein or peptide molecule is directly connected to the second protein or peptide molecule or, optionally, the first protein or peptide molecule and the second protein or peptide molecule and where the protein or peptide molecule and the second protein or peptide molecule and where the protein molecule is not an antibody, a member of the TNF family, and is not a radioisotope), depleting cells in an animal containing the polymolecule, a recombinant vector capable of expressing the polypoptide, expressing the polypeptide, capable of capable of expressing the polypoptide, in composition with one or more invention relates to a non-naturally occurring single chain protein

additional therapeutic compounds, displaying recombinant molecules (which molecules include a native or engineered immunoglobulin heavy chain crafion, the improvement comprising an immunoglobulin heavy chain region that includes one or more mutation, substitution, alteration, and/or deletion at one or more amino acid residue corresponding to positions 9, 10,11,12, 108, 110, and 112 in the heavy chain variable region) and a non-naturally occurring single chain antigen-binding protein having a mutation chosen from a list given in the specification. The polypeptides of the invention comprise single communoglobulin hinge region (wild-type or mutants where the cysteines are immunoglobulin (19d, 19E or 10g) heavy chain constant region (CH) which may also have mutations in CH2 (e.g. T256N) or a truncated CH3 (e.g. T4 cm), a 4 amino acid deletion). The polypeptide may be further linked to a non-antibody protein such as the transmembrane and cytoplasmic tail (TN/CT) of caspase-3, caspase-8 or CD80. The fusion polypeptides are useful for neutralization of an infectious agent (where the infectious agent is a bacterium, a virus, a parasite, or a fungus) and also for treatment of cancer, immune disorders, Grave's disease, Hashimoto's such are the contradict of arthritis, systemic lupus erythematosus. Slocery, when the contradict of the contradict of an infectious agent (where the infectious cyparance) thrombocytopenic purpura, multiple sclerosis and myasthenia cyparance. The present sequence is an antibody perion protein of the invention of the invention of the invention of the invention of the manner of contradicts and myasthenia contradicts and myasth ö 61 GELASTQSELTLSQKHWLSDRTYTCQVTYQGHTFEDSTKKCADSNPRGVSAYLSRPSPFD 120 127 180 187 240 247 300 248 NFMPEDISVQWLHNEVQLPDARHSTTQPRKTKGSGFFVFSRLEVTRAEWEQKDEFICRAV 307 9 63 68 GELASTQSELTLSQKHWLSDRTYTCQVTYQGHTFEDSTKKCADSNPRGVSAYLSRPSPFD 188 RDWIEGETYQCRVTHPHLPRALMRSTTKTSGPRAAPEVYAFATPEWPGSRDKRTLACLIQ 1 FTPPTVKILQSSCDGGGHFPPTIQLLCLVSGYTPGTINITWLEDGQVMDVDLSTASTTQE 8 FTPPTVKILQSSCDGGGHFPPTIQLLCLVSGYTPGTINITWLEDGQVMDVDLSTASTTOE 121 LFIRKSPTITCLVVDLAPSKGTVNLTWSRASGKPVNHSTRKBEKQRNGTLTVTSTLPVGT 181 RDWIEGETYQCRVTHPHLPRALMRSTTKTSGPRAAPEVYAFATPEWPGSRDKRTLACLIQ 241 NFMPEDISVQWLHNEVQLPDARHSTTQPRKTKGSGFFVFSRLEVTRAEWEQKDEFICRAV ninge, CH region, VL or VH) used in a fusion protein of the invention Gaps ö Length 327; Indels 100.0%; Score 1707; DB 9; 100.0%; Pred.                                                                                                                                                                                        The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2, 3 and 4 of the human IgE. It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as
                                                                                                                                                                                                                                                                                                                                                               9

New non-naturally occurring single chain protein comprising polypeptides with binding domain, connecting regions and N-terminally truncated immunoglobulin, having immunological activity, useful for neutralizing infectious agent.

Disclosure; Page 352; 590pp; English.

The invention relates to a non-naturally occurring single chain protein (I) comprising a first polypeptide having a binding domain polypeptide capable of binding to a first polypeptide having a binding domain polypeptide capable of binding to a target molecule, the binding domain polypeptide capable of binding to a target molecule, the binding domain polypeptide comprising a heavy chain variable region, which comprises an amino acid mubsitution or delation at one or more amino acid residues, a second to polypeptide comprising a conservation of the first polypeptide comprising a conservation of the first polypeptide attached to the second polypeptide where the non-naturally occurring single-chain protein is capable of an immunological activity, Alsa included are reducing a target cell population with a first protein or peptide that confidence a protein that is less than 150 kD, which involves to the subject a protein that is less than 150 kD, which involves to the subject a protein or peptide molecule and treating the target cell population with a second protein or peptide molecule are linked by a third protein or peptide molecule are linked by a third protein or peptide molecule and where the connected to the second protein or peptide molecule are linked by a third protein or peptide molecule are linked by a third protein or peptide molecule are linked by a third protein or peptide molecule are linked by a third protein or peptide molecule are linked by a conjugated with a bacterial toxin, a cylotoxic drug, or a radiologroppy depletion or peptide molecule and where the conjugated with a bacterial toxin, and whore the protein or peptide molecule and is not conjugated with a bacterial toxin, and where the companishing the polymetical with a bacterial toxin, and or the polymetical and and an animally. A polymetical propertied a native or engineering an immunollobulin heavy companishing the polymetical are region, the improvement comprising an immunollobulin indeed a native or more amino acid residue comprise singl disease, rheumatoid arthritis, systemic lupus erythematosus, Sjoegren' syndrome, thrombocytopenic purpura, multiple sclerosis and myasthenia gravis. The present sequence is an antibody peptide or fragment (scFV, VL or VH) used in a fusion protein of the invention treatment of cancer, immune disorders, Grave's disease, Hashimoto's ninge, CH region,

The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (FeepsilonR). Also provided are nucleotide sequences encoding such a fusion protein. The fusion molecules and compositions are useful for treating an IgE mediated biological response, preferably an IgE-mediated chological response, preferably an IgE-mediated choraction, such as methna, allergic rhinitis, atopic dermattis, severe food allergies, chronic urticaria, angioedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, crype-I diabetes mellitus, or multiple sclerosis, and for preventing of, or symptoms resulting from, a type I hypersensitivity reaction in a construction of the const
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               108 FTPPTVKILQSSCDGGGHFPPTIQLLCLVSGYTFGTINITWLEDGQVMDVDLSTASTTQE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an immunoadhesin comprising: (a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising a rhinovirus receptor protein linked to at least a portion of an immunoglobulin heavy chain, and (b) optionally a J chain and secretory component associated with the chimeric ICAM-1 molecule. The immunoadhesin has plant-specific chimeric ICAM-1 molecule activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and release of the common cold by HRV. The immunoadhesin binds to HRV and release of viral RNA and formation of empty capsids. Expression of the immunoadhesin in plants would be tetrameric, rather than dimeric. Immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal continuous chain increases the stability of the immunoadhesin in the mucosal continuous chain increases the stability of the immunoadhesin in the mucosal continuous chain increases the stability of the immunoadhesin in plants than in

A;Title: Structure and evolution of the heavy chain from rat immunoglobulin E.

A;Recession: A9342;

A;Reserven umber: A93442; MUID:83064537; PMID:622865

A;Reservence: umber: A93442; MUID:8316293; PMID:622865

A;Resperimental source: strain. LOU/c/Wel, immunoglobulin epsilon heavy chain: construction, impactions and immunoglobulin epsilon heavy chain: construction, impactions and immunoglobulin heavy chain: construction, impactions and immunoglobulin heterotetramer subunit consists of two identical light (kappacted)

A;Contents: Myeloma IR162

A;Molecule type: mRNA

A;Reference number: A90937; MUID:83182019; PMID:820340

A;Contents: Myeloma IR162

A;Molecule type: mRNA

A;Residues: Wijstone cases; such as 19A and 19M, the subunits associate into 18

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kappacted); immunoglobulin heterotetramer; immunoglobulin homology < IM2>

A;Complex: An immunoglobulin homology < IM2>

E53116
Ig epsilon chain C region, secreted splice form (clone CH4-3'UT-CH5-M2'') - human (fragm C;Species: Homo sapiens (man)
C;Species: Homo sapiens (man)
C;Date: 06-Oct-1994 #sequence_revision 18-Nov-1994 #text_change 21-Jan-2000
C;Accession: E53116
